

Dr. Schnabel  **FLUROFLEX®-N**

POLYFLURON® PTFE Bellows DIN/ASME

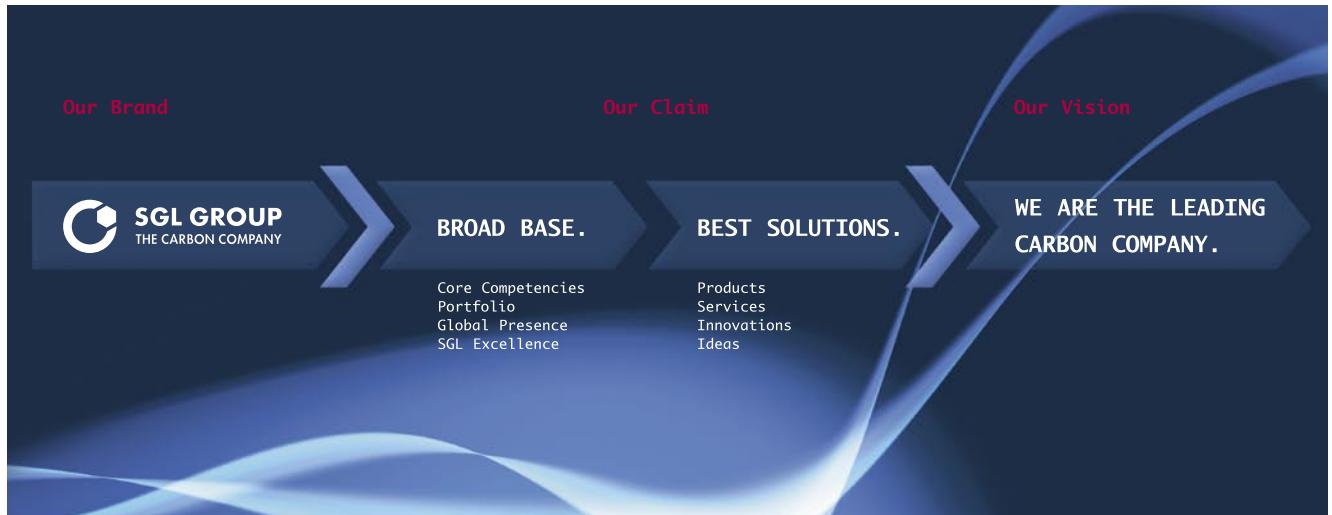

Process Technology

Broad Base. Best Solutions.

 **SGL GROUP**
THE CARBON COMPANY

SGL Group – The Carbon Company

SGL Group – The Carbon Company – is one of the world's leading manufacturers of carbon-based products. We have a comprehensive portfolio ranges from carbon and graphite products to carbon fibers and composites.

Our core competencies include a wide knowledge of raw materials, specialized production expertise and in-depth application and engineering know-how. As a result, we have built up a comprehensive technology and product portfolio. We operate on a global scale and are close to our customers anywhere at any time. Supported by this broad base, we offer our customers the best solutions. That is what SGL Excellence stands for.

Process Technology

Perfection in Graphite and PTFE

Our Business Line Process Technology is focused on supporting the technical processes of our globally operating customers in the chemical industry, metal manufacturing and environmental protection technology. A maximum degree of know-how and expertise in corrosion protection, a global presence and full-package systems from a single source: that's what our customers need – and get from us:

- ▶ Long-standing experience and a high level of expertise in process technology
- ▶ Comprehensive process, material and design know-how on graphite, PTFE and silicon carbide (SiC)
- ▶ Closeness to customers: cost-effective manufacturing to international and local standards at our production sites in Europe, America and Asia, and worldwide customer service
- ▶ A consistently high standard of quality

Our comprehensive range of products and services extends from process equipment and components made from DIABON® graphite and POLYFLURON® virginia, paste-extruded PTFE through LICUFLON® skived PTFE sheet-lined steel equipment FLUROFLEX® bellows, FLUROPIPE® pipe systems, FLUROSIC® silicon carbide heat exchangers and DIABON® graphite or exotic metal pumps, to the planning and assembly of complex systems.

FLUROFLEX®-N Bellows up to DN 150/6" come with chromated flanges

R&D, Engineering & Manufacturing Performance

Dr. Schnabel FLUROFLEX® bellows are manufactured from virgin paste-extruded POLYFLURON® PTFE. They are designed for maximum flex-life in a wide range of high temperature/high purity Chemical Process Industries (CPI) applications. General FLUROFLEX® bellows or flexible connectors or expansion joints, are used in piping systems to absorb vibration caused by rotating equipment, to absorb thermal expansion and contraction of piping systems and protect stress-sensitive process equipment (glass, glass-lined steel, FRP, graphite, dual laminate, etc.). PTFE is ideal for use as a bellow material because of its near universal corrosion resistance, low spring rate and near unlimited flexlife. Providing this system flexibility, any bellow is virtually designed to be the most sensitive link in a piping system. Dr. Schnabel has conducted longterm POLYFLURON® PTFE studies to ensure comprehensive understanding of all aspects of the bellow design, manufacture and quality control to maximize performance and safety. We can supply our POLYFLURON® PTFE with static dissipating (antistatic) properties suitable for use with solvents and other liquids where static build up is an issue.

The steps in engineering & manufacturing optimization process were:

1. Optimize bellow geometry and wall thickness to achieve maximum burst pressure and minimize spring rate.
2. Manufacture the bellow according to the principles found in the theoretical calculations, without reducing the bellow performance due to manufacturing limitations.
3. Use best available PTFE liner (POLYFLURON® PTFE) to form the bellow.
4. Define operating parameters such as operating pressures that are important to the customer and take into account, that the lifetime of the bellow is influenced by PTFE creep.
5. Comply with the European Pressure Equipment Directive.

Engineering and Manufacturing Expertise

Optimize Bellow Geometry and Wall Thickness

For the optimization of the bellow design it is important to find a careful balance of wall thickness and bellow geometry. A thin wall thickness will lead to a low burst pressure but also good flexibility. A high bellow wall thickness without a change in bellow geometry and a limitation on bellow movement will lead to premature failure due to PTFE crimping (over compression in convolution radius).

Dr. Schnabel conducted a Finite Element Analysis (FEA) to optimize the bellow geometry and wall thickness. This Analysis showed clearly, that the maximum stress on the POLYFLURON® PTFE is in the inside of the convolution (green/yellow zone in Figure 2). Dr. Schnabel FLUROFLEX® bellows are designed to minimize the stress peak in this most sensitive area during operation.

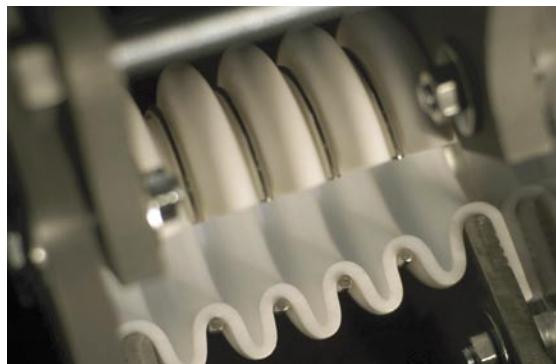

Fig 1 Dr. Schnabel FLUROFLEX® bellow with the assured uniform wall thickness.

Manufacturing of Bellows

Dr. Schnabel FLUROFLEX® bellows are made of virgin paste-extruded POLYFLURON® PTFE and are formed without machining. Dr. Schnabel FLUROFLEX® bellows are formed in such a way, that a uniform wall is assured.

Best Liner

Through more than 50 years of experience, Dr. Schnabel has continuously optimized the POLYFLURON® PTFE processing techniques to manufacture bellows. After sintering, Dr. Schnabel's virgin paste-extruded POLYFLURON® PTFE has uniform strength in both axial and lateral directions. The porosity, crystallinity, density, and tensile strength are constantly measured and controlled to guarantee the best performance. In addition, tests have shown that virgin paste-extruded POLYFLURON® PTFE is far superior to isostatically molded PTFE in terms of permeability reduction. See for example NACE-Paper 400.

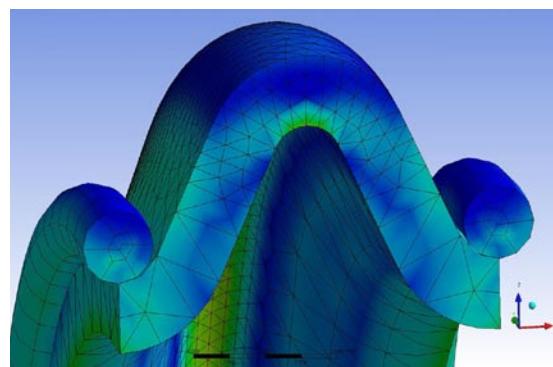

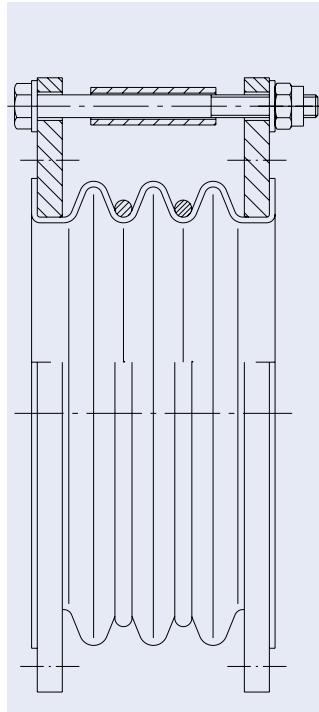

Fig 2 Finite element of a theoretical bellow. The maximum stress is found on the inside of the outside convolution (green/yellow zone). The minimum stress is found on the outside of the convolution (blue zone).

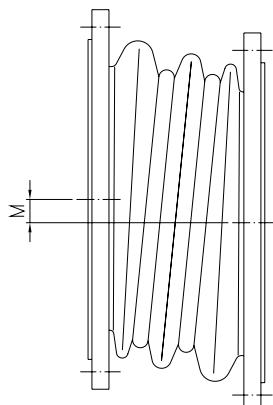

Family of the FLUROFLEX® PTFE Bellows

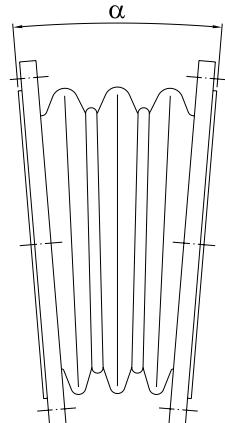

FLUROFLEX®-N 1 to 6

(1-6 Convolutions)
up to ND 2500 (100")

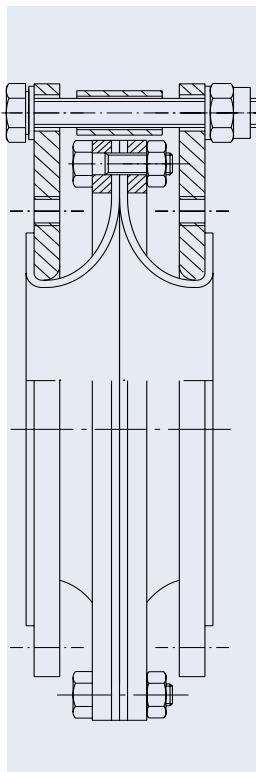

See page 10 to 13

Lateral Movement

Angular Movement

FLUROFLEX®- 0

(for Full vacuum)

ND 200 (8") to ND 1400 (56")
Full vacuum rating to 200°C
Eliminates internal vacuum support rings made from expensive alloy.

See page 14

Features and Options:

These bellows feature Dr. Schnabel's compression stops that prevent damage to the POLYFLURON® PTFE convolutions from over compression of the bellows in case pipe supports are not sufficient. Dr. Schnabel bellows are vacuum resistant, for details see page 21.

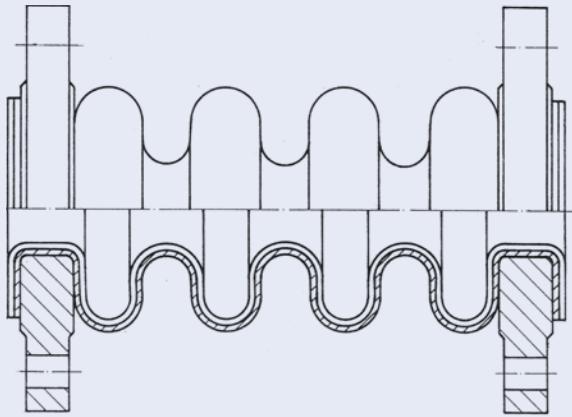

Non-standard flanges and clearance holes are available. Stainless steel flange material, J-Bolt flanges according to various standards are possible to customer specification. Reducing flange arrangements can also be supplied.

Axial/Lateral/Angular

Movement Restriction

Dr. Schnabel FLUROFLEX® bellows can be supplied with tie rods engineered to restrict movements to customer requirements.

Dr. Schnabel can also provide plain lateral or plain angular (hinged) bellows.

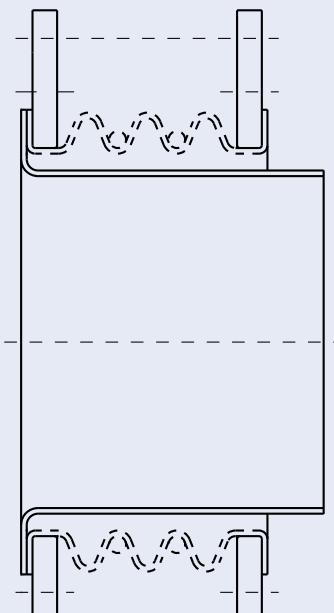

**FLUROFLEX®- 16
(for PN16)**

also available for PN25 or N10

ND 40 (1,5") to ND 600 (24")
Combines corrosion resistance of
POLYFLURON® PTFE and high
pressure rating of a stainless steel
bellows. Multiple metal construc-
tion (HASTELLOY®, Titanium, etc.
are also available) to minimize
spring rate.

See page 15, 16

FXS Smoothbore Sleeve

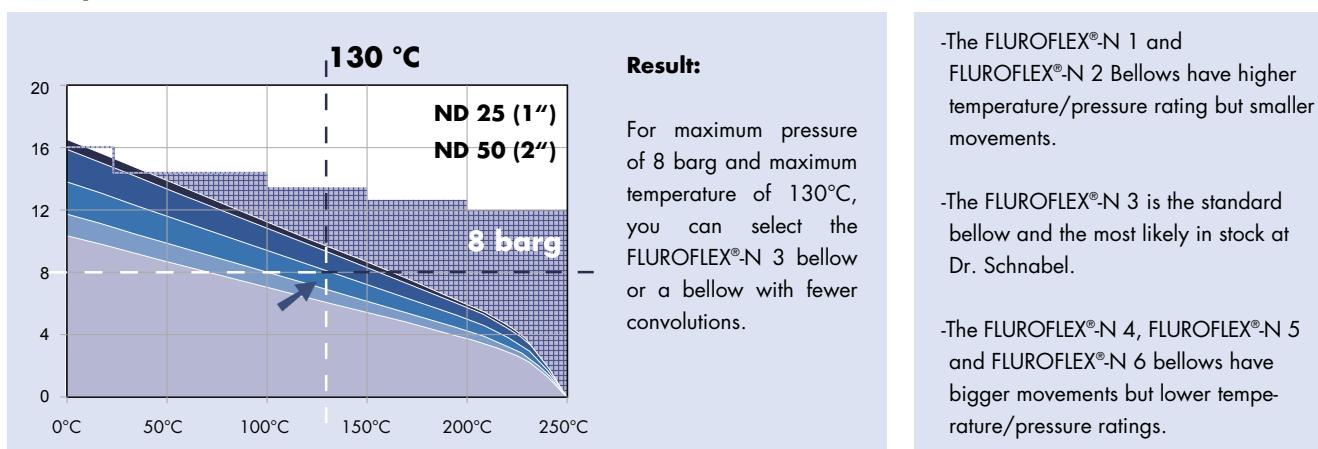

Prevents damage to POLYFLU-
RON® PTFE convolutions in abra-
sive service and prevents build-
up of solids in the convolution.
POLYFLURON® PTFE is standard,
but alloys are also available to
customer-specified requirements.

See page 17, 18

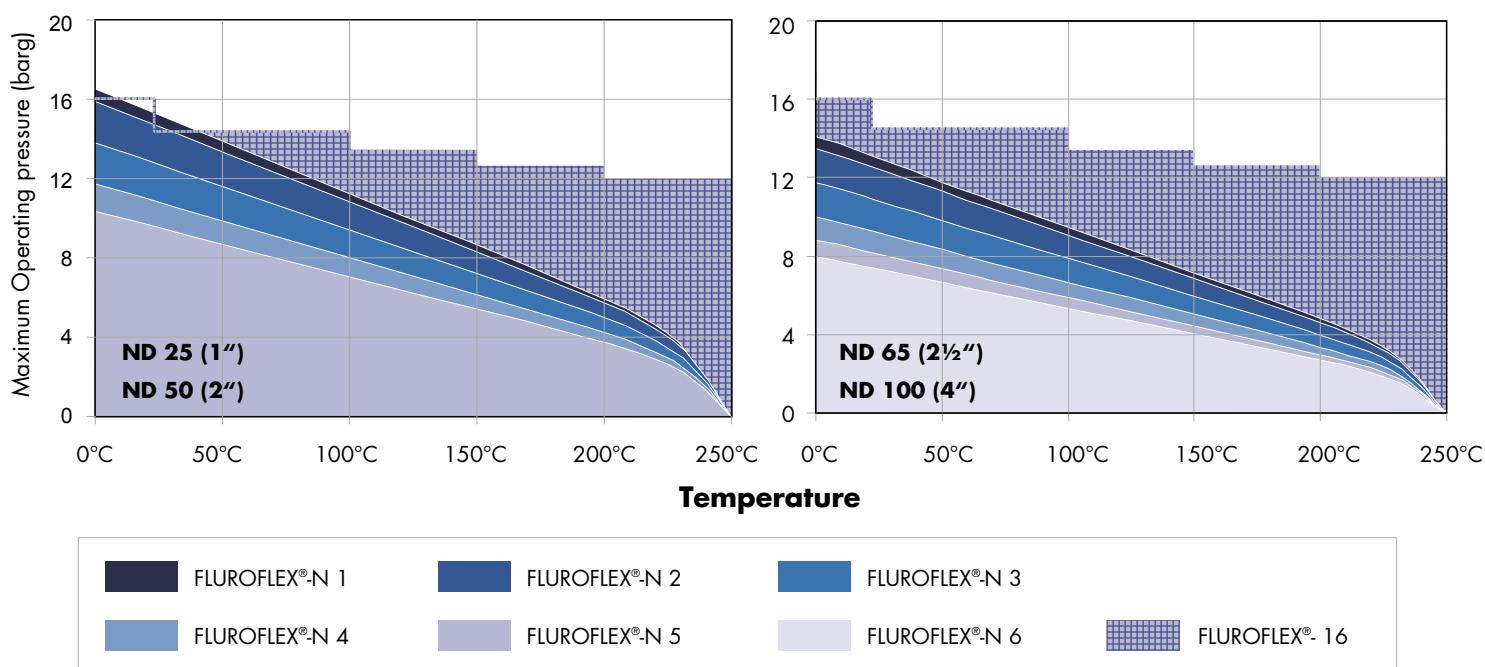

How to use the Temperature-Pressure diagram

Start by selecting the diagram with the nominal size of the bellow required. Continue by selecting the maximum operating pressure on the vertical axis and then the maximum operating temperature on the horizontal axis. The cut area where the two lines meet determines the appropriate type of bellow for your application. Although, bellows above this cut area (with fewer convolutions) can be likewise selected, bellows below this cut area are not recommended, due to their lesser temperature/pressure resistance. **Rule of thumb:** Bellows with fewer convolutions offer higher temperature/pressure ratings, but smaller movements compared to the bellows with more convolutions. The more convolutions the bigger the movements but the lower the temperature/pressure ratings. These temperature pressure diagrams are based on extensive research at a German University, TUEV and Dr. Schnabel. They contain safety margins starting with a minimum of 300% for new bellows at 20°C. In accordance with test regulations, we tested FLUROFLEX®-N bellows for long term operation at 150°C following DIN EN ISO 9080 and DVS 2205-1 sheet 21 with a safety factor of 2. For applications with high operating pressures and high temperatures, we recommend our POLYFLURON® PTFE lined bellows with metal body (FLUROFLEX® -16 / 10 / 25).

Example:

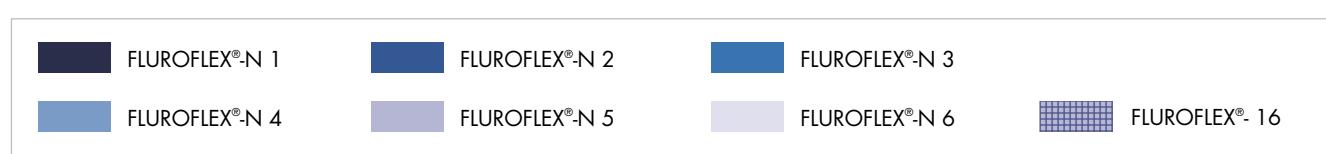

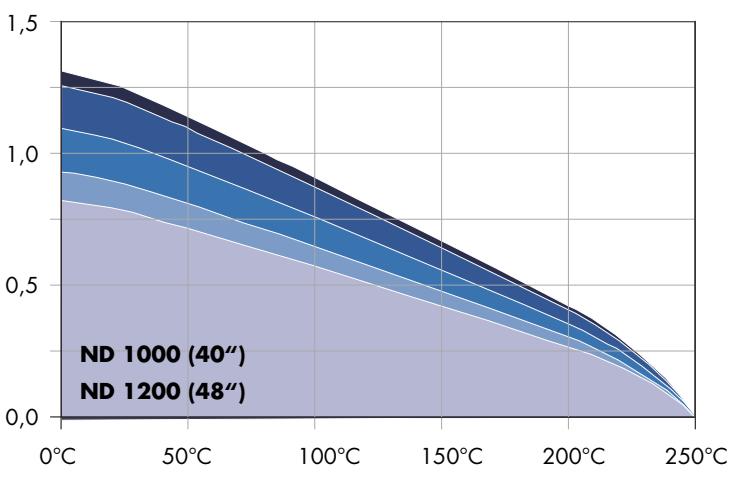

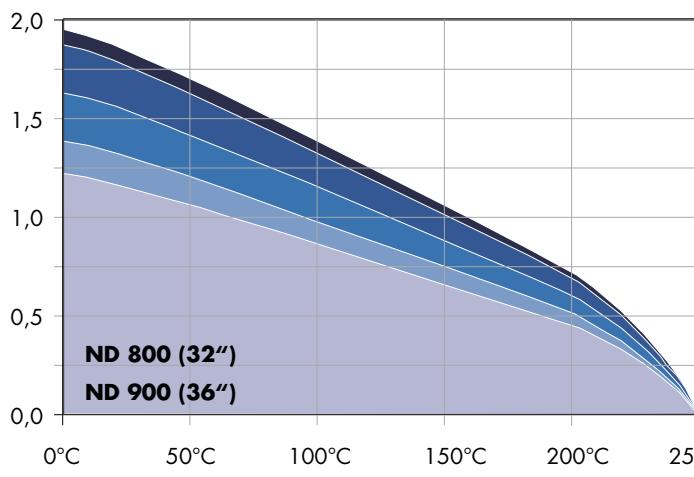

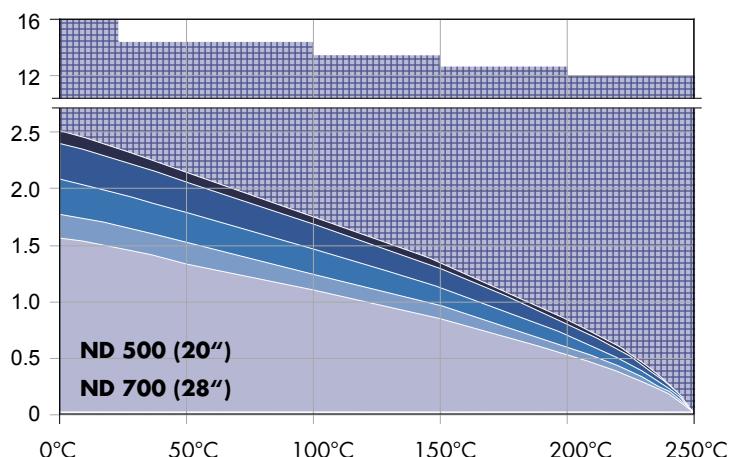

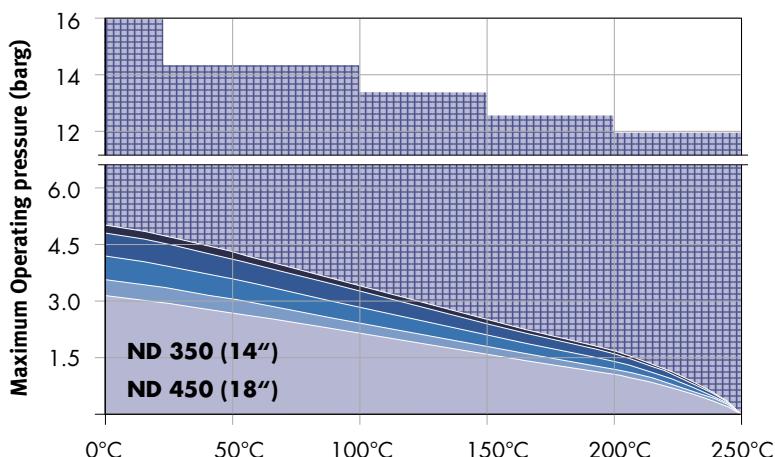

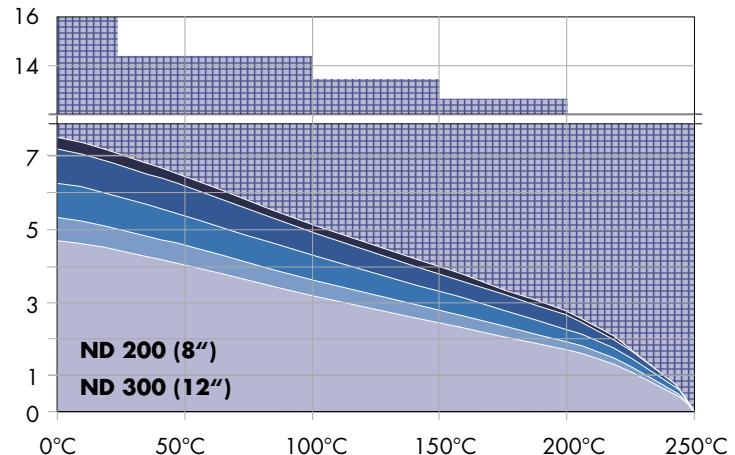

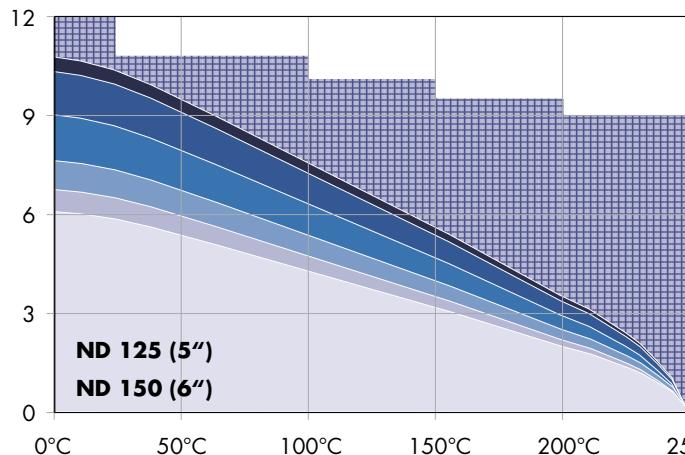

Maximum operating pressure versus temperature

Maximum operating pressure versus temperature

Please contact us if the specified operating pressure is not sufficient for your application.

FLUROFLEX®-N1 to FLUROFLEX®-N2

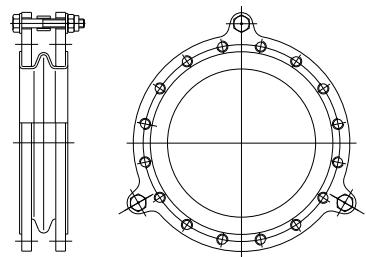

All FLUROFLEX® bellows are supplied with carbon steel flanges as standard:

Special flange designs are available on request.
(i.e. flanges for glass connections).

- 1) Flange drilling according to DIN 2501 PN 10 (the diameters ND 1300 and ND 1500 are not considered in the DIN standards)
- 2) Flange drilling according to ASME B 16.5 150 lb, from ND 28" to ND 60" according to MSS SP-44 150 lb.

The max. movements (axial, lateral, angular) indicated in the table, are values for non combined movements. For values at combined movements please contact us.

Flanges are threaded, except for the FLUROFLEX®-N2 from ND 80 up to ND 400.

Operating temperature range: -10°C up to +250°C.

3) neutral length can be adjusted within min & max. length 4) at mentioned neutral length
Technical specifications are subject to change without notice.

FLUROFLEX®-N3 to FLUROFLEX®-N4

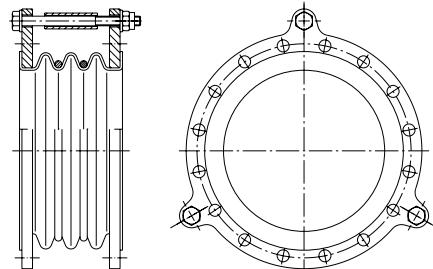

All FLUROFLEX® bellows are supplied with carbon steel flanges as standard:

- 1) Flange drilling according to DIN 2501 PN 10 (the diameters ND 1300 and ND 1500 are not considered in the DIN standards)
- 2) Flange drilling according to ASME B 16.5 150 lb, from ND 28" to ND 60" according to MSS SP-44 150 lb.

Flanges on FLUROFLEX®-N3 and FLUROFLEX®-N4 up to ND 65 (2 1/2") threaded, from ND 80 (3")

onwards are with clearance holes. Special flange designs are available on request. (i.e. flanges for glass connections).

The max. movements (axial, lateral, angular) indicated in the table, are values for non combined movements. For values at combined movements please contact us.

Types of FLUROFLEX® Special Bellows

Hinged Typed (angular) FLUROFLEX® Bellows

Hinged bellows allow only angular movement of the bellows about the centre of the bellows. This type of bellow can serve as a directional anchor for the piping system. The hinges are designed to carry the full weight of flooded pipe mounted to the bellows.

When combined with a bellow having slotted hinges these bellows can be used to handle large lateral misalignments using only two bellows as shown on the right.

Hinged and slotted FLUROFLEX® bellows allow axial movement of the bellow in addition to angular movement.

Lateral FLUROFLEX® Bellows

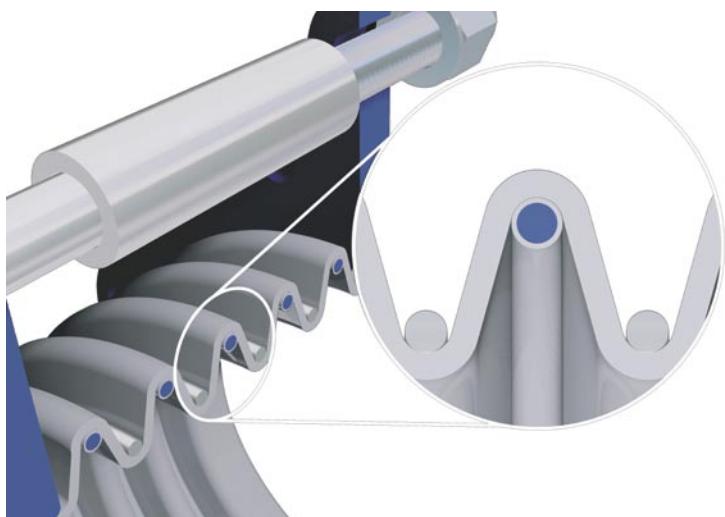

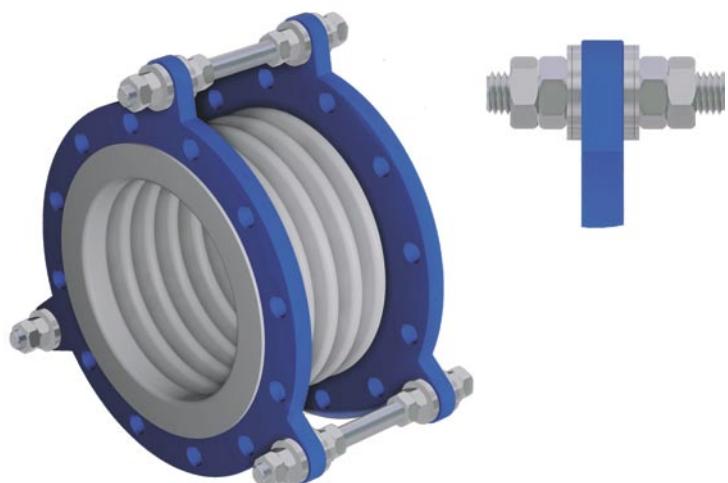

The flanges of a FLUROFLEX® bellow can be tied using spherical washers and nuts that eliminate or reduce the axial travel of the bellow yet allow for full lateral offset of the bellow. This type of bellows replaces a direction anchor when properly located in the pipeline.

The spherical nuts and washers are supplied in carbon steel as standard.

FLUROFLEX®-N1 to N6 bellows with internal support rings for higher vacuum resistance

FLUROFLEX®-N1 to N6 bellows can be supplied with internal vacuum support rings made of virgin paste-extruded POLYFLURON® PTFE lined stainless steel rings. These rings increase the vacuum resistance of the bellows up to full vacuum depending on bellow size. The internal support rings are available also made of virgin paste-extruded POLYFLURON® PTFE lined HASTELLOY®, Tantalum etc.

A special design and manufacturing method of the ends of these rings provide long life-time for this component, as long as the bellows are used within our recommended limits.

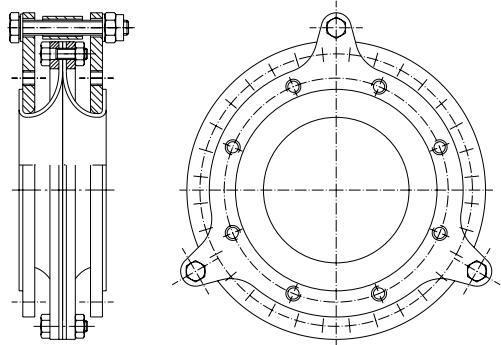

FLUROFLEX®- 0, Bellows for Full Vacuum

The FLUROFLEX®- 0 bellow for FULL VACUUM is available from ND 200 (8") to ND 1400 (56")

- 1) Flange drilling according to DIN 2501 PN 10
- 2) Flange drilling according to ASME B 16.5 150 lb, from ND 28" to ND 40" according to MSS SP-44 150 lb.

All flanges are with threaded holes. Special flange designs are available on request (in example flanges for glass-connections).

The max. movements (axial, lateral, angular) indicated in the table, are values for non combined movements. For values at combined movements please contact us.

Operating temperature range: -10°C up to +250°C.

1) at mentioned neutral length Technical specifications are subject to change without notice.

Features and Options:

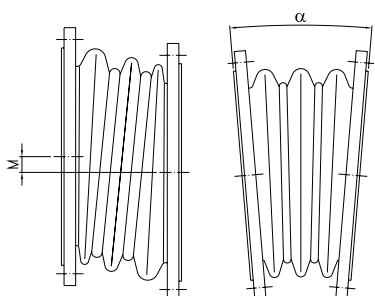

These bellows feature Dr. Schnabel's compression stops that prevent damage to the POLYFLURON® PTFE convolutions from over compression of the bellows.

Stainless steel flange material, J-Bolt flanges according to various standards are possible to customer specification. Reducing flange arrangements can also be supplied.

Axial/Lateral/Angular Movement

Dr. Schnabel FLUROFLEX®-0 bellows are mainly designed for axial movements.

Lateral Movement Angular Movement

FLUROFLEX®- 16, PTFE lined Metal Bellows for High Pressure

The FLUROFLEX®- 16 is available from ND 40 (1 ½") to ND 600 (24").

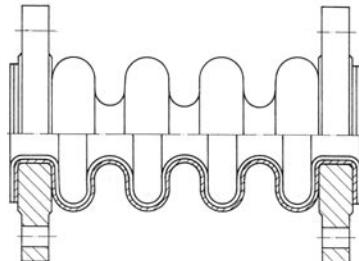

Combines corrosion resistance of POLYFLURON® PTFE and the high pressure rating of a metal bellows. Multiple metal layer design minimizes spring rates.

FLUROFLEX®-10/16/25 bellows are supplied standard with carbon steel flanges and stainless steel body.

1) Flange drilling according to DIN 2501 PN 10.

2) Flange drilling according to ASME B 16.5
150 lb.

Special flange designs are available on request.

Safety Shields

It is highly recommended to use safety shields around flange connections and bellows if corrosive or other dangerous media is handled! Especially when the plant is used under the European Pressure Equipment Directive.

Please ask for our detailed RAMCO® Safety Shield catalogue.

Temperature correction factors (TCF) for spring - rate conversion		
80°C		0.65
120°C		0.5
150°C		0.4

Example:

spring rate @ 120°C =
spring rate @ 20°C x 0,5

Materials of construction/How to order

Materials of construction

flanges:	S235 JRG2 up to ND400/16"
	S355 J2G3 from ND450/18" upwards
surface protection:	flanges ND200/8" and bigger are painted with 2-components epoxy paint RAL 5003 smaller diameters are zinc galvanized & yellow chromated
bellow material:	virginal paste-extruded PTFE, white
external support rings:	1.4571, similar to AISI 316 Ti
tie rods:	8.8 A2P, carbon steel zinc galvanized
support flange:	S235 JRG2, painted with (FLUROFLEX® - 0) 2-components epoxy paint RAL 5003

Options:

flanges:	stainless steel, etc.
bellow material:	virginal paste-extruded PTFE, anti-static, black
external support rings:	HASTELLOY®, POLYFLURON® PTFE-lined metal
internal support rings:	stainless steel, HASTELLOY®, etc. always POLYFLURON® PTFE-lined
tie rods:	stainless steel, etc.
support flange:	stainless steel (FLUROFLEX® - 0)

How to order:

Example:

FX - N2 - 300 - D - C - C - W - 110 - SP - ANG - FXS
 | | | | | | | | | |
 A - B - C - D - E - F - G - H - I - J

A: number of convolutions 0 = means vacuum bellow 16 = means metal bellow POLYFLURON® PTFE-lined	E: flange material C = carbon steel S = stainless steel	H: TA = vacuum support rings tantalum/POLYFLURON® PTFE-lined HA = vacuum support rings HASTELLOY®/POLYFLURON® PTFE-lined
B: ND (mm or inch) according to flange standard under „C“	F: PTFE w = white a = anti-static	I: bellow type STD = standard bellow ANG = hinged bellow for plain angular movement LAT = plain lateral bellow AXI = bellow for plain axial movement
C: flange standard A = ASME 150 lbs D = DIN PN10 J = JIS	G: shipped length within min./max. range in mm or inch	
D: C = clearance holes T = drilled and tapped S= standard	H: internal support rings - = no rings SP = vacuum support rings stainless steel/POLYFLURON® PTFE-lined	J: FXS = with smooth bore sleeve

Quality Management

by Process Technology

As a manufacturer of carbon and graphite products, process equipment and systems for the chemical industry and environmental protection technology, SGL Group maintains a targeted quality management system designed to attain and meet the product quality standards demanded by customers. Our quality management system meets the requirements of DIN EN ISO 9001:2000 and Pressure Equipment Directive 97/23/EC Annex III, Module H/H1 and has been certified by the approved associations of DQS and TÜV SÜD. In process equipment construction, Quality Management is responsible for the testing and approval of semi-finished graphite products, impregnating resin, cement components, outsourced parts, process equipment and components.

Heat exchanger during pressure testing

Synthetic resin impregnation, cementing and assembly are all subject to continuous monitoring. Appropriate marking of the semi-finished graphite products before and after synthetic resin impregnation, during machining and thereafter until assembly of the complete equipment or plant provides comprehensive evidence of the semi-finished products employed. Consequently, they meet the traceability requirement of specification AD 2000-Merkblatt N2 for pressure vessels made from electrographite and hard burned carbon. The conditions for synthetic resin impregnation of the semi-finished graphite products and those for cementing of the components are stipulated, monitored and checked.

Evidence of the quality characteristics of the material grades employed, as required by specification AD 2000-Merkblatt N2, is provided in a report issued by the testing laboratory of TÜV SÜD Industrie Service GmbH.
